

`npx create vite@latest`

```
server:{
  port: 5173,
  open: true
}
```

What is JSX

- JSX is HTML inside javascript.(This is wrong)
- JSX is HTML or XML like structure written in javascript. Example :

main.jsx file

```
import { createRoot } from "react-dom/client";

const h1 = <h1>Hello world</h1>;

// const root = ReactDOM.createRoot(document.getElementById("root"));
// root.render(h1);

const Header = () => {
  return <h1>Hello from component</h1>;
};

createRoot(document.getElementById("root")).render(<Header />);
```

JSX working

vite get the code and convert into the react element. vite/plugin-react give the power to convert the JSX into js code and this is treated as a js object.

Component :

It is a javascript function which returns JSX. component name always starts with capital letter those type of function which returns JSX is said to be components

To call the component in a react we have to write like a html open closing tag. component call returns JSX and that JSX will taken by vite and convert them in react element and by render method convert them in tag and put to html.

1. function based component
2. class based component

Strictmode

Interview Questions

1. What is JSX

2. Rules to write JSX.
